Abstract

This paper describes the ontology for the domain of Information Security. The two main areas of review are Information Security and Ontology. The review covers the work done in the two areas and highlights the definitions, concepts, applications and issues related to these areas. The domain of Information Security is broad and exclusive thus the use of ontology in this domain is important in ensuring a clear understanding of the terms and technologies used.

1. Introduction

This demo file is intended to serve as a “starter file” for IEEE conference papers produced under L^AT_EX using IEEEtran.cls version 1.7 and later. I wish you the best of success.
